Developed Countries Downswing – Emerging Markets
Inflation Requires Restrictive Policies

Prof. Dr. Norbert Walter

Deutsche Bank Research
Agenda

1. The global economy - heterogeneous downswing
2. USA – strong enough to avoid a technical recession?
3. Euro area – the decoupling debate is over
4. EMs – last pillar of global growth challenged
5. Philippines – weathering the storm
6. Conclusion – damned fragile world
The Global Economy
Heterogeneous Downswing
Global economic downswing – but no technical recession

Global growth slowing
Real GDP, yoy

- Higher commodity, food prices and - due to the high inflation rates - more restrictive monetary policy will dampen global growth.
- US economy is well below its potential due to the sub-prime crisis.
- Emerging Markets - the last pillar of global growth - challenged.

Source: DB Research
Supply grows modestly – Demand, while checked by effort to save, still on the rise

Oil price has tripled since 2005

Brent Blend, USD bbl.

- Opposite economic impact of higher oil prices for consumer and supplier countries.
- With little spare capacity left, the market is highly vulnerable to potential terrorist attacks or renewed military action in the middle east.

Source. DB Research
Could we see a replay of the seventies?

- The hike in oil prices is due to a demand boom and not like in the seventies due to a cut in supply.

- The increasing demand is an indicator of the high economic growth rates during the last years, especially in the emerging markets.

- The global economy is less vulnerable to oil price hikes compared to the seventies – due to:
  - Higher absorption of the Oil exporting countries (“Petrodollar-Recycling”)
  - Higher Energy efficiency
  - Share of oil in global trade has decreased significantly since the seventies

- But oil is still the most important single product in the world – it still has a high impact on the economic development.
Not only oil is expensive

Commodity price index
Index 1990=100

- Rising demand from Emerging Markets is not limited to energy related raw materials.
- Nearly all kinds of raw materials are effected by an increasing demand.
- While supply is - at least in the short run - rather inelastic.
- Since 2003 most commodity indices doubled.

Stagflation established?

- Inflation rates are well above the target rate all over the world.
- This raises the probability of a Stagflation scenario.
- Will the FED and some Asian central banks raise interest rates?
The US Economy
Strong enough to avoid a technical recession?
Sub-prime crisis has been the trigger for the sharp US slowdown

Housing market reversed

Far below potential but no technical recession

- It seems that monetary/fiscal activities should prevent the economy from falling into technical recession:
  - Fiscal stimulus package
  - Massive cut in the Fed Funds rate
  - And as a consequence the depreciation of the dollar

Inflation too high for too long

Will an increasing output gap and decreasing oil prices reduce inflation?

- Headline inflation is more than twice as high as the target rate.
- With pressure still in the pipeline and too permissive monetary policy, high headline inflation is lasting for a while.
- Conflict for the FED – priority for growth versus fighting rising inflation.

Sources: BLS, DB Research
USA: Fed Funds rate too low?

- The gain of bailing out homeowners and financial institutions has to be weighted against the long-run cost of re-anchoring inflation expectations later on.

- Thus, even with a weak economy in mind the FED is - due to the persistence of high inflation - forced to raise interest rates.

- Or: Is the FED playing with its credibility?

A U-shaped economy in the US

- Should the USD depreciate further, inflationary pressures in the United States would increase.

- A cocktail of a weak economy, necessary monetary tightening and further write downs of financial institutions makes for a wide open U-shape.
The Euro Economy
The decoupling debate is over
Decoupling – again proves to be a red herring

Recession in several European economies is possible due to real estate and construction crises.

Long-term growth potential of the Euro economy is low due to the demographic challenge.

Sluggish economic growth
% yoy

Sources: Eurostat, DB Research
Exchange rate of the Euro poses a burden on exports

The massive appreciation of the Euro against the USD decreases the competitiveness of the Euro-area.

Export-oriented companies suffer heavily from the current exchange rate which is well above the calculated equilibrium exchange rate.

The export losses are only partly substituted by the increasing demand from the oil exporting countries.

The positive exchange-rate effect of more purchasing power has been taken away by the high energy and food prices.

Rising Risk of Stagflation

- Structural deficits make it most likely that the Euro economy is growing close to its low potential in the foreseeable future.

- High Inflation is long lasting all over Europe.

- Several European countries are on the brink to a recession due to necessary corrections in their construction and real estate sector.
Emerging Markets
The last pillar of global growth challenged

Current global financial turmoil hits Asia

Asian stocks get hit
Index Jan 2007=100

- Stock and bond markets will likely suffer - bias toward buying “real” store of value as gold and hard commodities.
- Real estate markets should hold up reasonably well – but rising interest rates and poor growth outlook will cap the upside this year.
- Corporate and FI credit outlook stable at best – more vulnerable to negative outlook.

Source: Global Insight
Still dependent on the US but raising Intra-regional trade

Asian trade has expanded significantly, export-led growth model is still predominant.

But US slowdown has a significant impact on Asian growth prospect.

But Intra-regional trade has been expanding more rapidly and now makes up over 40% of total trade.

Less dependent from US growth.

Too high inflation all over Asia

Inflation Rates:
- China: 6.3%
- India: 12.0%
- Vietnam: 27.1%
- Thailand: 8.9%*
- Indonesia: 11.9%
- Malaysia: 7.7%*
- Philippines: 12.2%
- South Korea: 5.9%
- Pakistan: 24.3%
- Singapore: 7.5%*
- Sri Lanka: 26.6%
- Hong Kong: 6.1%*
- Taiwan: 5.9%

More tightening to come

Many Asian central bank rates are below inflation rates.

High energy- and food prices driving inflation.

Declining subsidies for fuel and food in many emerging markets are accentuating the rise in measured inflation.

* 3M LCY deposit rates minus headline inflation

Sources: Bloomberg, CEIC, DBR
Will emerging and developing countries follow DCs into a cyclical downswing in 2009?

- US financial market turmoil also hits Emerging markets.

- High inflation will force most Asian economies to increase their interest rates and allow their currencies to appreciate.

- Thus the Asian economic momentum will be weakened as of 2009.
5 Philippines
Weathering the storm
Macro fundamentals still okay but inflationary pressures are high

Growth to slow from 2007 high

Rapidly rising inflation forces BSP to tighten

6 Conclusion
Damned fragile world
Degree of uncertainty – a few extra standard deviations

- Variance of forecasts as an indicator
- Divergence of monetary policy – will the ECB find followers?
- Main global risks:
  - Inflation
  - Exchange rate movements
  - Global imbalances
Global downside risks

What else to be aware of:

- High inflation may un-anchor inflation expectations; monetary policy at risk to lose its credibility.

- Further large write-downs and spectacular bankruptcies would cause extra financial market turmoil.

- Protracted global slowdown could lead to more protectionism – Doha Round failed.

- Mid-East, Syria, Iraq, Iran, Afghanistan/Pakistan tensions escalate and oil price soars further.
